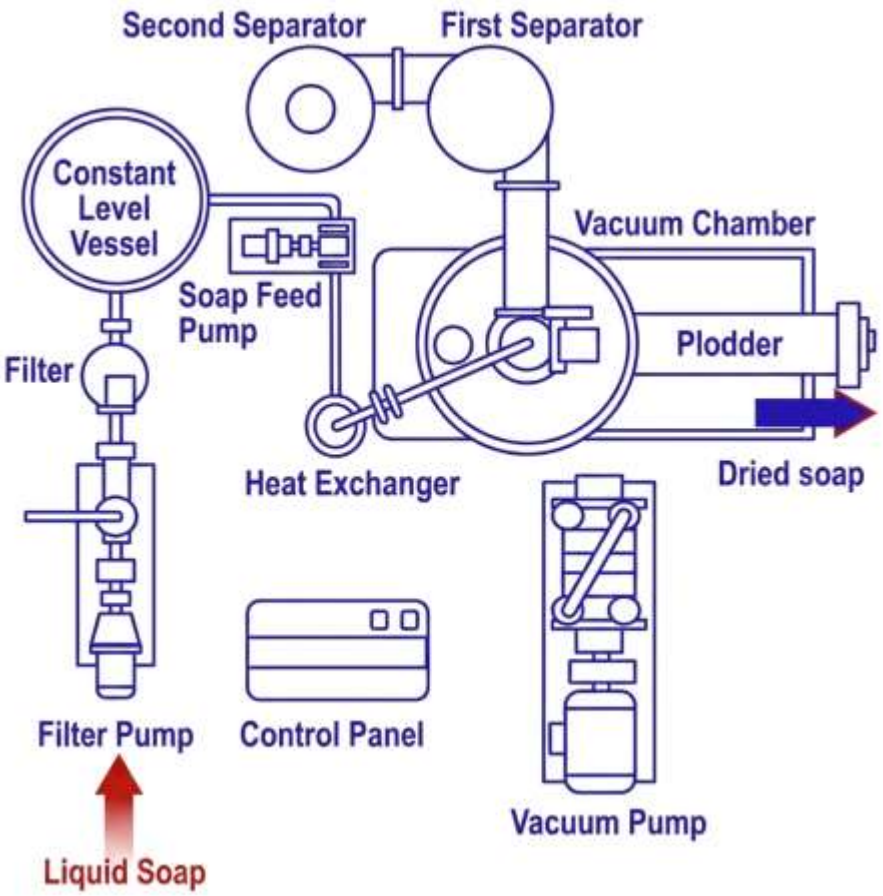
Advanced Soap Drying Line System

High-efficiency drying process designed to convert liquid soap into solid form with precise moisture control and consistent product quality.

The **soap drying line** is a critical stage in soap manufacturing where liquid neat soap is transformed into dried, solid soap through a controlled **vacuum spray drying process**. By combining advanced equipment such as the **atomiser, vacuum generating system, and powder separators**, the process ensures rapid moisture evaporation, uniform drying, and efficient material handling. This integrated system enhances product consistency, improves energy efficiency, and enables seamless operation across modern high-capacity soap production lines.



Heat Exchanger

The **heat exchanger** raises the temperature of liquid soap before it enters the vacuum spray chamber, enabling effective evaporation of excess moisture during the drying process. This controlled heating ensures consistent drying performance, improved efficiency, and uniform final soap quality.

Powder Separators

The **powder separators** remove fine soap particles from exhaust gases leaving the vacuum spray chamber, ensuring clean gas flow and preventing contamination of downstream systems. This improves plant efficiency, protects the condenser system, and supports better effluent management.

Vacuum Drying System

The **vacuum spray drying system**, including the vacuum booster, condenser, and vacuum pump, creates and maintains optimal vacuum conditions for efficient moisture evaporation. It enhances drying performance, reduces energy consumption, and ensures stable, continuous plant operation.

Atomiser

The **atomiser / vacuum spray chamber** converts liquid soap into dried, solid form within seconds by spraying it under controlled vacuum conditions. This ensures uniform drying, consistent quality, and smooth integration with refining or plodding equipment.

BRIT SOAP MACHINERY

Heat Exchanger | Liquid Soap Processing for efficient soap drying lines

Precision Heat Exchanger for efficient soap heating and moisture evaporation. Designed for controlled temperature performance and seamless integration in modern soap drying lines.

High-Performance Heat Exchanger for Liquid Soap Processing

The Brit Soap Heat Exchanger is a critical component in modern soap drying lines, designed to efficiently raise the temperature of liquid soap prior to entering the soap drying chamber. This controlled heating process ensures that excess water rapidly evaporates, enabling consistent soap quality and optimal drying performance.

Advanced Heat Transfer & Precise Temperature Control

The unit consists of a large number of small tubes through which the liquid soap is pumped. These tubes are externally heated by steam, ensuring **uniform heat transfer and efficient thermal exchange** while enabling precise control over soap temperature for optimal drying performance.

- Steam heating enables rapid and consistent temperature increase
- Multi-tube configuration ensures maximum surface area for heat exchange
- Designed for continuous and high-capacity soap production lines
- Temperature can be adjusted by varying steam pressure
- Flow rate of liquid soap can be controlled to regulate heating intensity
- Ensures controlled and consistent evaporation of excess moisture

Robust Stainless Steel Construction & Safety Engineering

Built for reliability, hygiene, and long-term industrial performance, the heat exchanger is constructed using high-grade stainless steel and engineered to meet stringent safety standards.

- Tubes: **AISI 316L stainless steel** for superior corrosion resistance
- Shell, diaphragms, plates, and cones: **AISI 304 stainless steel**
- Designed for long service life in demanding industrial environments
- Equipped with an **expansion joint** to handle thermal stress
- Designed operating (project) pressure: **8 – 10 bars**
- Pressure tested at **14 bars** to ensure safety and durability

Ideal for Modern Soap Manufacturing Plants

The **Brit Soap Heat Exchanger** is suitable for:

- Continuous soap drying systems
- High-efficiency soap finishing lines
- Industrial liquid soap heating and moisture removal applications

Key Benefits:

- Improves overall drying efficiency by enabling faster and uniform moisture evaporation
- Ensures consistent soap quality with controlled temperature management
- Enhances production capacity through continuous and stable operation
- Reduces energy wastage with efficient steam-based heat transfer
- Minimizes process variability, leading to better finish and reduced rework
- Built for reliability, resulting in lower maintenance and longer equipment life

BRIT SOAP MACHINERY

Powder Separators | Efficient powder separation for soap drying lines

High-efficiency powder separation for removing fine dust particles from vacuum spray chamber exhaust gases.

Powder Separators for Soap Drying Systems

The Brit Soap Powder Separators are a critical component in modern soap drying lines, designed to efficiently remove fine dust particles from gases exiting the vacuum spray chamber. This controlled separation process prevents soap particles from entering the barometric condenser cooling water, ensuring smooth plant operation, improved effluent management, and consistent overall system performance.

Efficient Dust Removal Process in Soap Drying Systems

The **Brit Soap Powder Separators** efficiently remove fine dust particles from gases exiting the **Vacuum Spray Chamber**, ensuring cleaner exhaust flow, protecting downstream systems, and improving overall process efficiency.

- Effectively separates fine soap particles from exhaust gases
- Prevents soap carryover into the **Barometric Condenser cooling water**
- Reduces risks of contamination and operational disruptions
- Supports smoother **effluent discharge and wastewater management**
- Enhances overall plant efficiency and reliability

Robust Engineering & Durable Construction

Brit Soap manufactures **dual cyclone powder separators**, engineered for reliable and continuous industrial performance.

- Available with contact parts in **AISI 304 stainless steel** or **Carbon Steel**
- Designed for efficient cyclone-based particle separation
- Equipped with **catch pots at the bottom** of the separators
- Fitted with an **isolating valve**, allowing the drum to be emptied **without stopping the plant**
- Built for durability and long service life in demanding soap manufacturing environments

Ideal for Soap Manufacturing Plants – Key Benefits

The Brit Soap Powder Separators are ideal for:

- Continuous soap drying and vacuum spray systems
- Integrated soap processing and finishing lines
- Industrial plants requiring efficient dust and particle control

Key Benefits:

- Prevents contamination of cooling water systems in the Barometric Condenser
- Supports smoother plant operations and reduces effluent discharge issues
- Improves overall system efficiency by removing fine particles effectively
- Enables uninterrupted production with easy maintenance via isolating valve system
- Enhances environmental compliance and cleaner plant operations

BRIT SOAP MACHINERY

Vacuum Drying System | Vacuum Booster, Condenser & Pumps for soap drying lines

High-efficiency vacuum system designed to optimize moisture removal, improve drying performance, and enhance energy efficiency in modern soap manufacturing lines.

Integrated Vacuum System for Efficient Soap Drying

The **Brit Soap Vacuum Generating System** is engineered to create and maintain optimal vacuum conditions within the **spray drying plant**, enabling efficient moisture evaporation and consistent soap quality. By combining a **vacuum booster, condenser, and vacuum pump**, the system ensures reduced gas load, improved thermal efficiency, and stable plant operation.

Vacuum Booster

The **Brit Soap Vacuum Booster** increases the degree of vacuum available in the spray drying plant by reinforcing the action of the vacuum pump.

- Utilizes steam passing through a **venturi tube with a restricted throat**
- High-velocity steam flow pulls gases out of the **vacuum spray chamber**
- Generates a **higher vacuum level than a pump alone**
- Improves overall system efficiency and drying effectiveness
- Designed for continuous industrial operation with robust construction

Condenser

The **Brit Soap water-cooled direct contact type gas condenser** efficiently handles hot gases released from drying soap and the steam-operated vacuum booster.

- Cools hot gases, significantly **reducing their volume**
- Lowers the **gas load on the vacuum pump**, improving energy efficiency
- Ensures **maximum condensation of condensable vapours into liquid**
- Reduces non-condensable gases to **minimum possible volume**
- Engineered for reliable performance in high-temperature environments

Vacuum Pump

A **double-stage liquid ring vacuum pump** is used as part of the vacuum generating system.

- Evacuates air and **non-condensable gases** entering the system
- Maintains stable vacuum levels for consistent drying performance
- Designed for durability and continuous industrial usage
- Supports efficient operation of the overall vacuum system

Barometric Tower

The **Barometric Tower** serves as a structural and functional support system for the vacuum generating set in soap drying plants. By positioning the vacuum system at an elevated height, it enables efficient gravity-assisted discharge and stable vacuum operation, contributing to improved overall system performance and reliability.

Applications & Key Benefits

Ideal for:

- Soap spray drying plants
- Continuous soap manufacturing lines
- High-efficiency drying and moisture removal systems

Key Benefits:

- Enhances drying efficiency through improved vacuum levels
- Reduces energy consumption by lowering gas load on the pump
- Ensures consistent soap quality and moisture control
- Improves overall plant reliability and operational stability
- Optimizes performance of the entire soap drying line system

Barometric Tower for Vacuum System Integration

The **Barometric Tower** serves as a structural and functional support system for the vacuum generating set in soap drying plants. By positioning the vacuum system at an elevated height, it enables efficient gravity-assisted discharge and stable vacuum operation, contributing to improved overall system performance and reliability.

BRIT SOAP MACHINERY

Atomiser / Vacuum Spray Chamber for Soap Drying Systems

High-efficiency vacuum spray drying chamber for converting liquid neat soap into solid, cooled soap within seconds.

Advanced Vacuum Spray Drying Technology for Soap Manufacturing

The **Brit Soap Atomiser / Vacuum Spray Chamber** enables soap manufacturers to transform **liquid neat soap into dried, cooled, solid soap** in just a few seconds by boiling off excess moisture under **carefully controlled vacuum conditions.** This rapid drying process ensures **consistent soap quality, improved efficiency, and seamless integration with downstream soap finishing equipment**.

Process & Functioning

The atomiser operates on a **continuous vacuum spray drying process**, ensuring rapid moisture removal and uniform solidification of soap. Its rotating internal mechanism allows efficient spraying, drying, and discharge within a single integrated system.

- The chamber is **cylindrical** with a **centrally mounted rotating shaft**
- Soap spray nozzle and **scraper blades are mounted on the shaft**
- As the shaft rotates, **liquid soap is sprayed onto the chamber walls**, where it rapidly solidifies under vacuum
- The **scraper blades remove the solidified soap** from the chamber walls
- Soap is then deposited into the **infeed throat of the outfeed plodder screw**
- A **bridge breaker is fixed at the bottom of the atomiser** to ensure smooth material flow

Engineering & Construction

Engineered for durability and precision, the atomiser features **robust stainless steel construction** and multiple design elements that ensure safe operation, easy maintenance, and long service life in industrial environments.

- Chamber designed for **vacuum-based rapid drying and efficient heat transfer**
- **Gland packing installed on the shaft** on both soap side and vacuum side for sealing
- Equipped with a **large bottom door** for easy entry and maintenance inspection
- Includes **two sight glasses with wipers** (top and bottom) for real-time monitoring
- Contact parts made in **AISI 304 stainless steel**, including the **duct connecting to the powder separator**
- Built for durability, hygiene, and continuous industrial operation

Applications & Key Benefits

The atomiser is a versatile component in soap manufacturing, supporting multiple production outputs and integrating seamlessly with refining and plodding equipment. It enhances both productivity and product consistency across the drying line.

Used for:

- Converting liquid neat soap into **solid soap base or noodles**
- Integration with **simplex refiner** for toilet, laundry, or multipurpose soap noodles
- Direct connection to **duplex vacuum plodder** for finished soap bar extrusion
- Suitable for **continuous soap drying and finishing lines**

Key Benefits:

- Rapid drying within seconds under controlled vacuum conditions
- Ensures **consistent product quality and uniform moisture removal**
- Supports flexible production (noodles or finished bars)
- Enhances overall plant efficiency and throughput
- Available in capacities ranging from **1 ton/hr to 4 tons/hr**
